Project Title	Student Attendance Management System Using Python
Week	Week-1

TASK-1

Student Attendance Management System Using Python.

Abstract:

This project presents a Student Attendance Management System developed using Python. It helps teachers record attendance digitally, stores student records securely, and generates attendance reports. The system reduces manual work, improves accuracy, and saves time.

Introduction:

Student attendance is an important part of academic management. Manual attendance is time-consuming and may lead to errors. A digital attendance system provides a simple and efficient way to record, manage, and monitor student attendance.

Theory:

- Stores student attendance records digitally.
- Records daily attendance accurately.
- Maintains student information in a database.
- Generates attendance reports automatically.
- Reduces manual work and errors.

Objectives:

- Develop a digital attendance system.
- Store student information securely.
- Record daily attendance.
- Generate attendance reports.

- Improve accuracy and efficiency.

Methodology:

1. Collect student details.
2. Store records in the database.
3. Mark students as Present or Absent.
4. Save attendance records.
5. Generate attendance reports.

Dataset:

The dataset includes Roll Number, Student Name, Department, Date, Attendance Status (Present/Absent), and Attendance Percentage.

Complexity Analysis:

The system performs attendance recording, searching, and report generation efficiently. Database operations require minimal processing time, making the system suitable for managing attendance records.

Results:

The system successfully records attendance, stores data securely, and generates attendance reports. It improves accuracy, reduces manual work, and saves time.

Conclusion:

The Student Attendance Management System provides a simple and efficient way to manage student attendance digitally.
